hic lc3 24 trial brief

Synthetic training content. Not a real Holcim trial report.

HIC-LC3-24 trial brief (synthetic)

> Synthetic training content for Gemini Notebook labs. Figures are illustrative only.

Purpose

HIC-LC3-24 tests whether an LC3-style calcined-clay limestone binder can meet a **42.5 MPa** 28-day class at a lower clinker factor than the CEM I control, and whether a subset of mixes can move to a plant-ready mix card for the synthetic **Loire Plant**.

What this brief may be cited for

- Trial name, purpose, and spec
- The selected mix results below
- What is still pending

Do not cite this file for literature comparisons. Those live in the literature excerpt.

Selected HIC results (not a full LIMS dump)

Mix ID	Binder family	Clinker factor	Age (days)	Compressive strength (MPa)	Versus 42.5 MPa spec
M01	CEM I control	0.95	28	52.4	Pass
M12	LC3-50	0.52	28	44.8	Pass
M12	LC3-50	7	31.4	(no 7-day spec)	
M13	LC3-50	0.50	28	41.2	Fail
M21	LC3-35	0.65	28	47.1	Pass

90-day cubes for M13 and M18 are still in the fog room. Do not report 90-day strengths from this file.

Talking-point rules

1. Cite this brief or the plant-handover note for HIC numbers. Do not invent a 20

target.

2. Separate **HIC trial results** from **published LC3 literature**.
3. Mix M13 failed 28-day spec. Do not describe the LC3-50 family as universally passing.
4. Do not claim ECOPlanet or ECOPact equivalence.
